Answer: C. Lunula. The lunula (shown), the visible region of the distal nail matrix, is most noticeable on the thumb, although the eponychium may partially or completely cover the lunula. Absence of the lunula (anolunula) of the thumb should prompt investigation for anemia or malnutrition. [1,11] However, this may also be a normal finding. Anolunula of other digits is nonspecific.

Nail changes are rarely the first sign of illness. Other symptoms almost always appear before that happens. For instance, emphysema causes breathing problems much earlier than it does clubbed nails.

This successful book, first published in 1980 and now in its fourth edition, provides an authoritative guide for busy practitioners trying to keep pace with current trends in small animal orthopaedic surgery. In this new edition Hamish Denny and Steven Butterworth have retained the same practical approach but have completely rewritten and updated the book to provide a comprehensive review of

orthopaedic and spinal conditions in the dog and cat. The illustrations have also undergone a major overhaul and the many line drawings are now combined with photographs and radiographs to clarify diagnostic and surgical techniques. Although the size of the book has increased, its regional approach to problems still enables the reader to use it as a rapid reference guide. It will prove an invaluable source of information for veterinary practitioners diagnosing and treating orthopaedic and spinal problems, while postgraduate students taking further qualifications in orthopaedics will find a sound basis for their studies and further reading provided here.

The purpose of this book is to guide the dermatologist and the general physician in the differential diagnosis and treatment of melanonychias. Melanonychia is a longitudinal pigmentation of the nail and it is considering a common presenting problem in general dermatology. The differential diagnosis varies from subungual hematoma to a fungal infection to a melanocytic lesion (hypermelanosis, lentigo, nevus, and melanoma) among others. Melanonychia may also indicate an early stage of nail melanoma, and its diagnosis remains a challenge among dermatologist. A recent publication on Dermatologists accuracy in early diagnosis of melanoma of the nail matrix showed that in situ melanoma of the nail matrix is very difficult for dermatologists to diagnose, regardless of the level of their experience. On Melanonychias the reader will find a complete discussion about all the most important topics on this condition, since its basic aspects (such as nail anatomy and epidemiology) until applied topics (including clinical features, nail biopsy and treatment).

The primary intent of this book is to familiarize the medical practitioner with the "nail unit" in a way which will render,

correctly and more easily, the diagnosis of nail diseases. At the same time, it serves to encourage the treatment and corrective measures of the abnormalities, if possible, based on anatomical and physiological knowledge. The chapters on anatomy, regeneration, and nail formation are basic to the author's intent. The content of the references quoted represents information which is proven and not controversial material. In addition, my own material not previously published is included. I would like to introduce the anatomical concept that the nail unit consists of four different epithelial structures, each with its own characteristics, yet all interrelated. These four constituents are the Proximal Nail Fold (PNF), the Matrix (M), the Nail Bed (NB) and the Hyponychium (HYP). A disease may occur in any number of or all nail unit structures. A clear understanding of the anatomy, histology, and tissue kinetics of each constituent will be necessary and is the key factor in interpreting the abnormal findings of each of these constituents as disease occurs. It follows, therefore, that treatment and corrective measures should include the knowledge of not only the nail but also of its relationship to the bony phalanx and the digit.
