Preliminary chapters are supposed to give suitable transition from structural analysis &e classical methods studied by students in their compulsory courses. Then structure approach to matrix method is dealt so that the students get clear picture of matrix approach. Finally, stiffness matrix method &e element approach is explained and illustrated so that before developing computer program student will understand what to instruct computer. Finally, a chapter on computer programming preliminaries which will help to develop the computer program and cautious the way of program develop by the others is included.

Using a general approach, this book supports the student to enable mastery of the methods of analysis of isostatic and hyperstatic structures. To show the performance of the methods of analysis of the hyperstatic structures, selected beams, gables and reticular structures are selected and subjected to a comparative study by the different methods of analysis of the hyperstatic structures.
